

substitute paragraph for page 8:

When the test at decision diamond [28]32 is negative, meaning that the stream of data blocks have been processed in a forward iteration, the logic proceeds to state 36, wherein the previous block value B is initialized. Moving to state 38, a DO loop is entered for each $i = N$ to 1 in a backward plain text chaining iteration using the round of the cipher that follows the round used at state 30. Proceeding to state 40, the i th block is XORed with the value B. The result both changes the i th block, and becomes the new value B. Moving to state 42, the i th data block is scrambled using one round of a cipher. In the first iteration through the backward chaining process, the second round of the cipher is used.
